HS (Health Sciences) 1301

Mondays & Wednesdays 8:35am - 9:55am

## Lecture 5: Nomenclature

Please feel free to introduce yourself to your neighbors– name, pronouns, a hobby, etc.

*and/or*

Answer the first question on Wooclap!

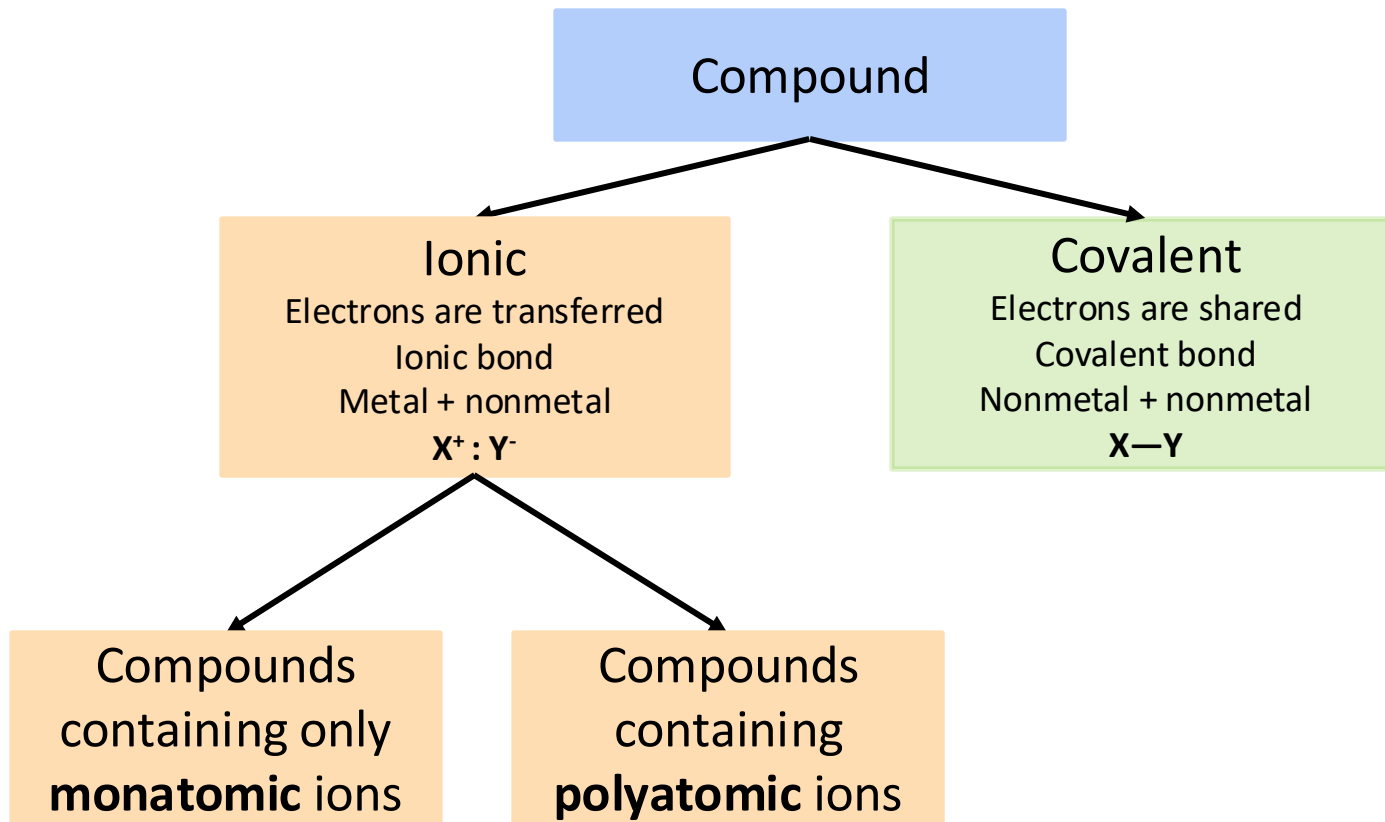

# Learning outcomes Topic 5: The Molecule – Nomenclature

- Use IUPAC rules to name binary ionic and binary covalent (molecular) compounds
- Use accepted names for common polyatomic ions

## Why is it important to name compounds?

- Learning how to accurately name compounds will save you LOTS of time and hassle later!
- Chemical compounds are on many products we encounter in our lives!

# Rules for naming compounds depend on the type of compound

# Ionic Compounds

- A **metal cation** (+ charged ion) and a **nonmetal anion** (- charged ion) or any combination of **molecular or elemental ions**
- For an ionic compound to be **stable** its chemical formula must be **neutral**
- Ions combine to form an ionic lattice

e.g. NaCl is made up of  $\text{Na}^+$  and  $\text{Cl}^-$   
or sodium ion and chloride ion

called: **Sodium chloride**

Each  $\text{Na}^+$  is associated with 6  $\text{Cl}^-$   
and each  $\text{Cl}^-$  is associated with  $\text{Na}^+$

# Binary ionic compounds: only containing monatomic ions

- Contain monatomic metal cations and non-metal anions
- Two types of metals
  - only 1 charge
  - Have more than one stable charge (transition metals)

		1															17	18	
	1	H <sup>+</sup>	2														H <sup>-</sup>		
	2	Li <sup>+</sup>															N <sup>3-</sup>	O <sup>2-</sup>	F <sup>-</sup>
	3	Na <sup>+</sup>	Mg <sup>2+</sup>	3	4	5	6	7	8	9	10	11	12	Al <sup>3+</sup>			S <sup>2-</sup>	Cl <sup>-</sup>	
Period	4	K <sup>+</sup>	Ca <sup>2+</sup>				Cr <sup>2+</sup> Cr <sup>3+</sup>	Mn <sup>2+</sup>	Fe <sup>2+</sup> Fe <sup>3+</sup>	Co <sup>2+</sup> Co <sup>3+</sup>		Cu <sup>+</sup> Cu <sup>2+</sup>	Zn <sup>2+</sup>					Br <sup>-</sup>	
	5	Rb <sup>+</sup>	Sr <sup>2+</sup>									Ag <sup>+</sup>	Cd <sup>2+</sup>				Sn <sup>2+</sup> Sn <sup>4+</sup>		I <sup>-</sup>
	6	Cs <sup>+</sup>	Ba <sup>2+</sup>										Hg <sub>2</sub> <sup>2+</sup> Hg <sup>2+</sup>				Pb <sup>2+</sup> Pb <sup>4+</sup>		
	7																		

# Metals that form more than one ion

Element	Ion Formula	Systematic Name	Common Name
Chromium	$\text{Cr}^{2+}$	chromium(II)	chromous
	$\text{Cr}^{3+}$	<b>chromium(III)</b>	chromic
Cobalt	$\text{Co}^{2+}$	cobalt(II)	
	$\text{Co}^{3+}$	cobalt(III)	
Copper	$\text{Cu}^{+}$	<b>copper(I)</b>	cuprous
	$\text{Cu}^{2+}$	<b>copper(II)</b>	cupric
Iron	$\text{Fe}^{2+}$	<b>iron(II)</b>	ferrous
	$\text{Fe}^{3+}$	<b>iron(III)</b>	ferric
Lead	$\text{Pb}^{2+}$	<b>lead(II)</b>	
	$\text{Pb}^{4+}$	lead(IV)	
Mercury	$\text{Hg}_2^{2+}$	mercury (I)	mercurous
	$\text{Hg}^{2+}$	<b>mercury (II)</b>	mercuric
Tin	$\text{Sn}^{2+}$	<b>tin(II)</b>	stannous
	$\text{Sn}^{4+}$	tin(IV)	stannic

e.g.  $\text{CrI}_3$

mercuric chloride

# Naming binary ionic compounds

1. Name the cation (metal) first, then the anion (non-metal)
2. Name the anion (non-metal) replace its ending with the suffix – *ide*
3. For transition metals with multiple possible charges, write the charge in roman numerals in parenthesis after the name of the metal

Examples:

Chemical Formula	Name
KBr	Potassium bromide
CaCl <sub>2</sub>	Calcium chloride
Al <sub>2</sub> O <sub>3</sub>	Aluminum oxide
CrI <sub>3</sub>	Chromium (III) iodide
FeI <sub>2</sub>	Iron (II) iodide

Fe<sup>+2</sup>

I<sup>-</sup>

# Compounds containing polyatomic ions

- Sometimes, the anion or cation is polyatomic
- Polyatomic ions stay together as a charged unit

## Polyatomic Cations

$\text{NH}_4^+$	<b>Ammonium</b>
$\text{H}_3\text{O}^+$	<b>Hydronium</b>
$\text{Hg}_2^{2+}$	<b>Mercury(I)</b>

## Polyatomic Anions

$\text{CH}_3\text{COO}^-$ (or $\text{C}_2\text{H}_3\text{O}_2^-$ )	<b>Ethanoate (or Acetate)</b>	$\text{HCO}_3^-$	<b>Hydrogen carbonate</b> (or <b>bicarbonate</b> )
$\text{CN}^-$	Cyanide	$\text{CrO}_4^{2-}$	Chromate
$\text{OH}^-$	<b>Hydroxide</b>	$\text{Cr}_2\text{O}_7^{2-}$	<b>Dichromate</b>
$\text{ClO}^-$	Hypochlorite	$\text{O}_2^{2-}$	Peroxide
$\text{ClO}_2^-$	Chlorite	$\text{PO}_4^{3-}$	<b>Phosphate</b>
$\text{ClO}_3^-$	<b>Chlorate</b>	$\text{HPO}_4^{2-}$	Hydrogen phosphate
$\text{ClO}_4^-$	<b>Perchlorate</b>	$\text{H}_2\text{PO}_4^-$	Dihydrogen phosphate
$\text{NO}_2^-$	Nitrite	$\text{SO}_3^{2-}$	Sulfite
$\text{NO}_3^-$	<b>Nitrate</b>	$\text{SO}_4^{2-}$	<b>Sulfate</b>
$\text{MnO}_4^-$	<b>Permanganate</b>	$\text{HSO}_4^-$	Hydrogen sulfate (or bisulfate)
$\text{CO}_3^{2-}$	<b>Carbonate</b>		

# Naming compounds containing polyatomic ions

- Compounds containing polyatomic ions are named similarly to those containing only monatomic ions, except there is no need to change to an *-ide* ending, since the suffix is already present in the name of the anion
- Identify which are **monatomic ions** and **polyatomic ions**

## Examples:

Chemical Formula	Name
$\text{KC}_2\text{H}_3\text{O}_2$	Potassium <b>acetate</b>
$\text{NH}_4\text{Cl}$	<b>Ammonium</b> chloride
$\text{NaHCO}_3$	Sodium <b>Bicarbonate</b>
$\text{Mg}_3(\text{PO}_4)_2$	Magnesium <b>phosphate</b>
$\text{Al}_2(\text{CO}_3)_3$	Aluminum <b>carbonate</b>

# Learning check!

Name the following ionic compounds:

hydroxide ion

acetate ion

nitrate ion

carbonate ion

sulfate ion

phosphate ion

# Name to chemical formula?

Write the chemical formula for the following compounds:

a) Lead (IV) sulfide

a) Magnesium hydroxide (active ingredient in antacids)

$\text{OH}^-$	hydroxide ion
$\text{CH}_3\text{COO}^-$	acetate ion
$\text{NO}_3^-$	nitrate ion
$\text{CO}_3^{2-}$	carbonate ion
$\text{SO}_4^{2-}$	sulfate ion
$\text{PO}_4^{3-}$	phosphate ion

# Covalent (molecular) Compounds

- Atoms bonded covalently form individual, discrete assemblies called **molecules**

**Atoms far apart:** No interactions occur.

**Atoms closer:** Attractions (green arrows) between nucleus of one atom and electron of the other increase. Repulsions between nuclei and between electrons are very weak.

**Optimum distance:**  $H_2$  molecule forms because attractions (green arrows) balance repulsions (red arrows).

- Some compounds have common names:

**$H_2O$  = water**

**$NH_3$  = ammonia**

# Naming Covalent (molecular) Compounds

1. Name the **lower group number** or **lower electronegative** element first, using its element name unchanged
2. Name the second element using the suffix **-ide**
3. Add **greek prefixes** to indicate the numbers of each element in the compound

Number	Prefix	Example
1	mono-	NO – nitrogen <b>monoxide</b>
2	di-	CO <sub>2</sub> – carbon <b>dioxide</b>
3	tri-	BCl <sub>3</sub> – boron <b>trichloride</b>
4	tetra/tetr-	CCl <sub>4</sub> – carbon <b>tetrachloride</b>
5	penta/pent-	N <sub>2</sub> O <sub>5</sub> – <b>dinitrogen pentoxide</b>
6	hexa/hex-	SF <sub>6</sub> – Sulfur <b>hexafluoride</b>
7	hepta/hep-	IF <sub>7</sub> – iodine <b>heptafluoride</b>
8	octa/oct	P <sub>4</sub> O <sub>8</sub> – <b>tetraphosphorous octoxide</b>
9	nona/non	P <sub>4</sub> S <sub>9</sub> – <b>tetraphosphorous nonasulfide</b>
10	deca/dec	P <sub>4</sub> O <sub>10</sub> – <b>tetraphosphorous decoxide</b>

# Learning check!

wooclap

Write the name for the following covalent compounds:
